

Carton & Roll Calculator

(includes 10% cutting allowance)

1. Measure the length and the width of your room at the widest points. That gives you the square footage for the room.
2. Find the row and column corresponding to the square feet in the room and the product collection name that you are using.
3. The box where those intersect will contain the number of cartons you need.*

*If your room size falls between two numbers, use the larger number as your guide. Ex. A 10'x10' room is 100 square feet. Use the line for 108 square feet.

Collection Name	Grand Illusions	Exotics	Reserve	Illusions	Underlayment
